The given data is valid under the condition that the extrusions are structurally prevented from twisting. Sufficient evidence for both flexural buckling and torsional flexural buckling has to be provided. Values printed in blue indicate reaching of the tension limit with a safety factor of 1.35. Load figures include the dead weight of the extrusion, i.e. the indicated load can be used in whole for additional extrusions or exhibits. Flexible mounting was estimated for calculation so as to demonstrate load bearing capacity and deflection of the R 102 extrusion. In combination with the R 260 adaptor, the R 200 (or DFS 84) connector and the R 102 supporting beam feature a maximum moment of 5.5 kNm. The true deformation can be a little bit more than stated in the table below as any slippage between the components cannot be taken into account.

Maximum admissible load (in addition to dead load) and resulting calculated deflections of single span beams at permitted maximum deflection of 1/200 or 1/300 of span.

Load-bearing capacity – Beam extension examples with connector R 290

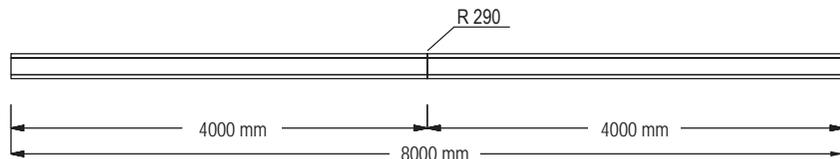

The following examples show how the possible load capacity increases in equally long constructions with hinged single span beams the closer the extension is in the edge area.

PLEASE NOTE: Static calculation of the construction might be necessary in particular cases!
